

From "Kampong" to "City in Nature" The story of chickens

Learning from Singapore
to be made in Taiwan

Government

The Singapore government manages chickens as both an ecological and social issue. It balances conservation with regulation by protecting wild species, restricting feeding and rearing, and using humane population control. This approach positions the government as a mediator between urban residents and chickens in the city.

people

Singaporeans see chickens with mixed feelings. Some value them as symbols of kampong memory and urban nature, while others view them as noisy or messy. This ambivalence shapes how people coexist with chickens in daily life.

What can we learn from Singapore ?

Taiwan can learn from Singapore by shifting perceptions of chickens from "dirty" to part of the urban ecosystem. Through public education, waste control, and humane management like egg collection, Taiwan can manage chicken populations more effectively. Data-driven policies and community participation will support a balanced coexistence between people and urban wildlife.
